Field of the Invention The present invention relates generally to interlock control systems and, more particularly, to a self-contained interlock system wherein the interlock system has a redundant controller to allow rapid shutdown of power during an emergency and to insure that an interlock operation does not trigger or set off a power failure 2. Description of the Prior Art Interlock systems are used in power equipment to ensure that certain operating conditions are not permitted while other conditions which can be permitted. Examples of conditions which may be controlled by interlock systems are: protected against short circuits, capacity limits, overload protection and cut in or cut out functions. FIG. 1 illustrates one type of previously known interlock system. The interlock system of FIG. 1 includes a series of switches 10A-N connected to a power source 12. Switches 10 are controlled by a central control unit 14 which is interconnected to the switches 10 through a data bus 16. The control unit 14 includes any suitable control circuitry which may be programmed or f678ea9f9e
